

AI OPERATIONS

**The assistant
is useful.
The chat is
not your record.**

Those are two different jobs. One tool is doing both. That is the problem.

The chat thread became the archive. Nobody decided that would happen.

- The tool was useful, so you kept using it.
- The tool could recall things, so you trusted the recall.
- A recall is a reconstruction. Not a row.

Chat was designed to be useful in the moment. Not to be searched three weeks later by someone building an invoice.

THE REAL ASSET

**The magic paragraph
is not the asset.
The boring table is.**

One row per job. Columns that never change.

Date. Client. Line items. Total. Follow-up. A row you can sort, filter, and pull into an invoice without searching anything.

That row lives forever. The chat history lives until the platform decides otherwise.

THE WRITE PATH

Five steps. The AI does the entry. You keep the record.

- 1. Raw input — voice, text, photo
- 2. Transcript — AI converts to text
- 3. Structured draft — AI extracts fields
- 4. Human check — you approve (40 seconds)
- 5. The record — approved row in your table

Step 4 is the one most people skip. That is where the system earns its integrity.

THE APPROVAL STEP

One spoken sentence is doing five jobs at once.

"Finished the job, took about four hours, materials ran around three hundred."

That is a time log, an expense, a client note, a cost basis, and a follow-up item in one sentence.

If the AI misreads "three hundred" as the labor rate instead of materials, you now have a billing record with the wrong number. And you do not know it yet.

ONE TEMPLATE PER RECORD TYPE

**Set it up once.
Use it every day after that.**

- Jobs template: date, client, job type, hours, materials, total, follow-up
- Expenses template: date, vendor, amount, category, receipt link
- Contacts template: name, company, role, source, last contact

Most operators need three templates. One hour of setup. The columns stay stable forever. The notes change every day.

THE CLERK DISTINCTION

**A clerk drafts.
A person approves.
That is how records
stay accurate.**

The AI is faster and cheaper than any clerk you have ever had access to.

It is still a clerk. It drafts. You approve. The record is yours.

When the separation is in place, the assistant gets more useful. You can trust what it returns because it is drawing from a table you control.
