

AI OPERATIONS

**The output
looks good.
Then you ask.**

Two people produced the same AI output. One can defend it. One collected it.

You cannot see the difference from the outside.

The problem is not that they used AI.

- The problem is that nobody can tell what they learned.
- Two people can produce the same AI output. One can defend it. One cannot.
- A manager watching from the outside cannot see inside the work anymore.

The only difference now is that the outside looks better than it ever has.

THE STANDARD

Three parts. Before it counts as your work.

Explain it

Not a summary of the output. The reasoning that produced it.

Verify it

Name the specific check that would have caught a mistake.

Own it

If it breaks next week, you are the person who answers for it.

THE REVIEW MOVE

Probe the person, not just the output.

Three questions. Two minutes.

Walk me through your reasoning.

What would you check if you suspected this was wrong?

What would you do differently if the underlying data changed?

You are not trying to catch them. You are trying to see whether the work left something behind.

WHAT STRONG ANSWERS LOOK LIKE

Strong answers mean one thing. Thin answers mean something else.

- **Strong:** Using AI to build. Give them harder problems.
- **Thin:** Using AI to skip. The correction is a slow-down, not a ban.

Make the next task one where the reasoning has to be visible first, before the assistant helps assemble it.

COACHING VS SURVEILLANCE

The frame changes what comes back.

Surveillance frame

Produces performance. People learn to sound like they understand.

Coaching frame

Produces honesty. People tell you what they actually understand because that is how they get better work.

This is a coaching rule, not a surveillance rule.

THE WHOLE STANDARD

Three words. One decision. Per output.

| **Explain it.**

| **Verify it.**

| **Own it.**

If all three are true, the tool helped. If they are not, the work is not done yet.

full/REFIT

Get the AI-Use Coaching card for managers.

Three questions mapped to common team AI use cases. A shared language for what using AI well actually means.
