

AI OPERATIONS

**The workflow
broke. They
blamed the
model.**

The model was fine. The surface was the problem.

Every surface answers five questions. Most people only check one.

- What does it see
- What does it change
- What does it run
- What does it keep
- **What does it prove**

THE BROWSER EXTENSION

It sees the page. That is all it sees.

Sees: the current tab only

Changes: page content or clipboard

Keeps: nothing across sessions

Proves: nothing

Wrong surface for continuity, files, or audit.

THE DESKTOP APP

**It produces text.
It does not run
anything.**

The conversation history is not a persistent file

Context-windowed. Deprecation-prone. Not connected to your filesystem or APIs.

An execution costume on a documentation tool.

THE CODING AGENT

**It runs code and writes to the repo.
The audit trail is the git log.**

- Can call APIs and write files
- Cannot run on a schedule without you
- Cannot see your screen

Right surface for execution. Wrong surface for automation.

THE CLOUD WORKER

It runs after your laptop closes. That is the only surface that does.

| Runs on a schedule. No human present.

| Can write to output stores and call APIs.

| Audit trail: only what you built into the job.

No logging built in means no answers when something breaks.

THE ONE-PAGE GRID

Four surfaces. Five questions. Twenty answers.

| Run your current workflow through all five

| Find the answer you are not sure about

| That is the surface mismatch

Most of the time it takes one afternoon to re-route. The model barely changes.
