

AI OPERATIONS

The backlog is lying to you.

A task that has sat there for three weeks is not a task. It is a rumor nobody checked.

Make it prove it is real.

WHY IT LIES

**It collects intentions,
not commitments.**

Every line felt urgent the day it went in. That feeling does not age. The item does.

A tracker remembers the what. It forgets the why.

THE RULE

**A task is not real
until it shows
evidence.**

One card makes it prove itself before it earns your time. Five fields. You can draw it on an index card.

THE CARD

Five fields.

1. Request
2. **Evidence**
3. Owner
4. Next action
5. Close condition

THE FIELD THAT MATTERS

Evidence is the one it cannot fake.

Priority is an opinion. Effort is a guess.

Evidence is a fact. A message, a file, a customer email, a real moment where the work came up.

Empty evidence field. Close it, or demote it.

THE OTHER THREE

Who, what next, and when it is done.

Owner

A person or a role. Not "the team." That is where accountability goes to hide.

Next action / Close condition

The single next move, as a verb. And what makes this done, decided now, not when you are tired and just want it gone.

THE PROOF

I made my agents build the cards.

A tool reads the day's real work and builds a card from what actually happened. When two describe the same job, it flags duplicate risk.

The backlog became a ledger with receipts.

full/REFIT

Get the five-field backlog evidence card.

One page. Run it on your top ten items in ten minutes. Most will not survive, and that is the point.
